

Coding and Solutioning

Date	15.11.2022
Team Id	B10-4A6E
Project Name	Project Assistance For Seniors Who Are Self-Reliant

Functional Features:-

In order to run a hospital or healthcare center, there are many more things that are needed in addition to a highly qualified team of staff. Well, there is a constant increase in the demand for high quality service, which makes it tough to run hospitals in the current situation. However, all the demands will be handled and managed by an efficient hospital management system software. In fact, it is mandatory to have such a software in any modern hospital. Such a software system will offer many useful features offered by both the custom solutions providers and vendors.

It could be an expensive decision to migrate from the dated systems to the modern healthcare management systems. But it is important to do it correctly in order to offer quick and high-quality care for the patients and efficient functioning of the hospital. Any hospital should consider the requirements of the staff, patients and the management board and overlay the same while

considering the vendors and custom solutions. Notably, the custom solutions can be created depending on the needs of the healthcare institution.

A capable hospital management system offers a great assistance to the doctors and lets them spend sufficient time with the patients than filling out the necessary documents. The modern day hospitals offer the right infrastructure to the staff, which collects the necessary patient information in a single database. This will help in checking the patient history and test results as it makes these processes relatively more efficient and faster.

In general, the **healthcare management systems** should have an array of features to help in the efficient functioning of the hospital. These key features are,

- An automatic call processing system
- Sending appointment notifications to the patients
- Sending results of medical tests to patients
- Filling of medical records automatically
- Quick patient registration process
- Consulting hours of doctors on the website

Eventually, all the systems and processes are automated and integrated into one huge system, which will ensure the seamless and smooth operations of the hospital.

Healthcare Management Systems Help Doctors Stick to Their Schedule

A hospital management software is quite valuable for the doctors. It helps them analyze and make decisions faster and accurately. Also, they can enjoy the benefits of flexibility, which is the need of the hour. A database template created with the requirements of the doctors and nurses is important. It helps them with the medical protocols that are related to the patient and edits the data that is already stored in the system.

These systems will focus on revenue management as well and will shorten the appointment duration without compromising on the quality of service. Doctors will stick to their schedule as the administration will analyze the same and will calculate the hours of work of each doctor, consider the hours of work spent in the rush hours, reduced time spent on the maintenance of equipment and the possible loss related to it. Basically, doctors will advise treatment protocols based on the dropdown list of all the illnesses that are recorded in the database. Also, it will draw an insight into the profitability of the hospital and demonstrate the profitable segments that should be explored. Also, there is a capability to track the campaign effectiveness using this software.

Important Features of Hospital Management

An efficient **hospital management system software** will have several useful features that are important and serve as the backbone of all the operations of the entire hospital. Some of the notable features of a hospital management software include the ability to edit and print patient details. It helps in a lot of ways as it has the current status of the specific patient, treatment plan, description of the ailment, patient complaints and more.

While making an appointment, the software also calculates the cost of the service automatically. The payment amount will be predetermined and the same will be known when the patient inquires for specific services at the reception while booking an appointment. Basically, a capable hospital management system software will automatically track the payment history of the patients. On request, the same can be printed along with a list of services that were provided and the amount of payments that have to be done for a particular period.
